

Healthy Homes Principles – what's the evidence?

June 2023

Decent homes are vital to give people a good foundation to thrive in their daily lives. Yet, one in ten people in the UK (over 6 million people) are living in poor quality housing. In addition, 4 million homes (14%) in England failed to meet the decent homes standard in 2022¹, and 2.6 million homes (11%) were found to be poor quality and 'hazardous' to occupants in 2021, according to the Building Research Establishment (BRE)².

People living in poor quality homes are twice as likely to have poor general health than people who do not (11% of people compared to 22%). Those from more disadvantaged groups are more likely to be living in poor quality housing – 22% of people in the lowest quintile income group live in poor quality homes, compared to 4% in the top quintile income group³.

There is a wealth of evidence which shows how the quality of our homes and neighbourhoods directly and indirectly impact both our mental and physical health. The BRE estimates that poor quality homes cost the NHS at least £1.4 billion every year²; as poor quality homes increase the likelihood of respiratory, cardiovascular, and communicable diseases, along with the risk of mortality⁴. Additionally, they increase the risk of severe ill health and disability during childhood⁵ and the proportion of children citing housing concerns as an obstacle to school attendance jumped from 11% in 2022 to 19% in 2023, an increase of 73%⁶.

To ensure better and more inclusive health outcomes, the TCPA has identified 11 Healthy Homes principles that all new homes must provide as outlined below.

Principle 1. Fire safety

In England, there were 275 fire-related fatalities in the year ending June 2022 compared with 251 in the previous year. 40,164 fire incidents were linked to dwellings and other buildings in that period.

With statistics like these it is imperative that our homes are built to be fire safe and exceed Building Safety Regulations to avoid tragedies like the Grenfell Tower fire.

Principle 2. Liveable space

More than two million children in England live in overcrowded accommodation with little or no personal space, and over 300,000 share beds with family members⁷.

Nearly a third of adults in Britain have experienced mental or physical health problems due to the condition or lack of space in their home during the Covid-19 lockdown; 52% of those who said their homes weren't big enough suffered from health problems according to a YouGov survey.⁸

Principle 3. Inclusive, accessible and adaptable

Building accessible homes is a vital part of ensuring that the nation's housing stock is sustainable and meets the needs of its residents. The Equality and Human Rights Commission lists mobility problems, indignity, poorer mental health, feelings of social isolation and anxiety all as impacts of non-accessible homes and reports that those without accessible homes are four times less likely to be in work.⁹

According to Habinteg, 70% of new homes built between 2020-2030 won't be required to meet any of the optional access standards necessary to improve accessibility and adaptability for older and disabled people.¹⁰ 104,000 people are on waiting lists for accessible and adaptable homes.¹¹

Principle 4. Access to natural light

There is strong evidence that natural light has a positive impact on mental health and circadian sleep cycles.

An analysis of 6,017 residents across eight European cities found that those with self-reported low levels of natural light were 1.4 times as likely to report depression and 1.5 times as likely to report a fall when compared to those satisfied with their home's light levels.¹²

Principle 5. Cut carbon emissions

Energy use in homes accounts for 14% of total UK carbon emissions¹³. Homes with poor energy efficiency and insulation contribute to energy insecurity and even fuel poverty. According to the ONS, over half of adults were worried about heating their homes this last winter¹⁴.

Whilst poorly insulated, cold and damp homes increase respiratory diseases and energy insecurity affects people's sleeping and levels of anxiety.

Principle 6. Access to amenities and transport

All homes should be designed with good access to public transport, the GP, schools, local shops and parks to support our health and wellbeing¹⁵. Public Health England found that neighbourhoods without active travel options (buses, trains, walking and cycling routes) negatively impact mental wellbeing and increase the risk of Type 2 diabetes, cardiovascular disease and musculoskeletal diseases.¹⁶

Access to green and blue (water-based) infrastructure has also been shown to mitigate stress and promote healthy lifestyles. A survey of 406 adults in Scotland found that the amount of green space in a neighbourhood was a significant predictor of stress levels.¹⁷

Principle 7. Safe from crime

The Government’s Safer Places guide states that most crime reduction through the planning system is delivered through crime prevention.¹⁸

When homes are purposely designed to build out crime, not only are communities safer, but our health and wellbeing benefits too. Studies confirm this, as neighbourhood crime can be a contextual predictor of mental health.¹⁹

Principle 8. Climate resilient

Since 2016, 570,000 new homes have been built that are not resilient to short term high temperatures²⁰. Heatwaves are causing higher rates of mortality, and those most likely to suffer are the very young, the elderly and people with chronic conditions like asthma²¹.

Homes also need to be resilient to increased risk from flooding and storms which can have a significant financial cost as well as negative impact on the mental health of people whose homes are affected²². The Environment Agency estimates that 5.2 million properties in England are at risk of flooding²³.

Principle 9. Prevent air pollution

Ambient and indoor air pollution in the UK is associated with approximately 28,000 to 36,000 deaths and costs the NHS £43 million each year.²⁴ Air pollution is the greatest UK environmental public health threat. It is responsible for 29,000-43,000 UK deaths annually (based on 2019 data) and multiple health effects. Between 2017 and 2025, the total estimated NHS and social care cost will be at least £1.6 billion in England²⁵.

Poor indoor air quality has been linked to lung diseases and increased risk of heart disease and stroke.²⁶ The health impacts of indoor air pollution are widely documented, and provisions must be made to ensure new homes minimise air pollution and do not contribute to unsafe levels.

Principle 10. Limit light and noise pollution

Findings by the World Health Organisation (WHO) state that noise is the second largest environmental cause of health problems, just after air pollution, and it can result in increased risk for cardiovascular disease, sleep disturbance, cognitive impairment and permanent hearing impairment.²⁷

Light pollution is also damaging to human health as it impacts our circadian cycle. CPRE reports that prolonged exposure to light pollution can lead to depression, sleeplessness and heart and blood problems.²⁸

Principle 11. Ensure thermal comfort

With the changing climate and increased occurrence of extreme weather events, it is imperative that our new homes provide year-round thermal comfort for residents. Poor thermal comfort undermines sleep quality and exacerbates cardiac, pulmonary and respiratory conditions²⁹. Over 700,000 homes in England were found to be 'excessively cold' in the winter³⁰, with the NHS spending over £540m a year treating people affected by the worst properties.

Poor insulation and limited ventilation also means that many homes are overheating in the summer. Over half of the UK housing stock (55% or 15.7 million homes) currently fails the bedroom overheating criterion³¹, and an estimated 791 excess deaths are associated with overheating every year in England and Wales³².
